Voices of Scleroderma Judith R. Thompson 2003-05 Contains anecdotes and experiences of people with scleroderma or with loved ones who have it.

Supporting People with Scleroderma Katherine Milette 2018 "Reducing the burden of chronic diseases has been identified as a health priority by National and International health organizations around the world, and community-based supportive interventions have been proposed as one possible way of achieving this goal. In general, receiving social support has been found to impact health and benefit many individuals with chronic disease who are engaged in disease management efforts. Scleroderma is a rare and complex rheumatic, autoimmune disease that affects the connective tissues and people who receive a diagnosis can experience a wide variety of challenges in their daily life. Because of the unique challenges that rare disease patients can experience related to the disease impact and navigating health care, people diagnosed with scleroderma may benefit from a variety of supportive interventions to help them better cope. However, no definitive conclusions can be drawn at this time about the unique support needs of people with scleroderma since qualitative investigations directly looking at coping and social support for scleroderma are limited. In the current dissertation research, two distinct focus group studies were conducted using a social constructionist framework. The purpose of Study 1 was to explore differing perspectives regarding the challenges experienced and strategies used while coping with scleroderma, through focus group discussions with people who have a diagnosis of scleroderma (4 focus groups, n=34) and health care professionals working with patients with scleroderma (1 focus group, n=8). The purpose of Study 2 was to perform an exploratory, follow-up investigation to Study 1 to deepen our understanding of patient perspectives about the influence of social support on the ability to cope with scleroderma (4 focus groups, N=19). Findings from Study 1 provided a deeper understanding of the unique challenges experienced by people with scleroderma while actively coping with the disease, including problems accessing information (e.g., from healthcare professionals), dealing with negative emotions (e.g., related to misunderstandings with loved ones), and accessing resources (e.g., effective scleroderma treatments). Study 1 also provided knowledge about helpful strategies to address those coping challenges (e.g., advocating for your needs and learning to problem solve). Next, findings from Study 2 showed that to better cope with their disease, individuals with scleroderma often relied on close social relationships to provide different types of support, such as emotional, informational, and instrumental support. In addition, different relational factors were identified that either enhanced or impeded the ability of people with scleroderma to rely on social support to cope with their disease, including different issues related to communication style, active engagement, and complementarity. Implications of the dissertation findings and future direction for research will be discussed." --

Relationships of Positive and Negative Affect to Coping and Functional Outcomes in Systemic Sclerosis Ingunn Hansdottir 2002 A vast literature has shown that chronic illness has a negative impact on emotional

adjustment. To date conceptual models guiding this research have focused on negative emotions and psychopathology. However, most people with chronic illness do not meet criteria for a diagnosable disorder, suggesting that our focus should be on normal emotional processes instead. Based on the two-dimensional model of emotion proposed by Watson and Tellegen (1985), which suggests two distinct factors of emotion, positive affect (PA) and negative affect (NA), the present study extended previous research by examining the role of both PA and NA in adjustment to chronic illness. It was hypothesized that PA and NA would represent distinct aspects of emotional well-being with separate influences on factors related to adjustment to chronic illness. Participants were 96 patients with confirmed diagnoses of Systemic Sclerosis, a severe and chronic rheumatic disease. As part of a larger longitudinal study, participants completed self-report measures assessing PA and NA (Positive and Negative Affective Schedule; PANAS), coping (Revised Ways of Coping Checklist), and functional outcomes (pain and disability measured with the Health Assessment Questionnaire). Confirmatory factor analysis indicated that PA and NA constituted separate, negatively correlated factors. The utility of assessing both PA and NA was further supported by differential relationships of PA and NA to coping and functional outcomes.

Hierarchical regression analysis showed that relations among coping, affect and functional outcomes were consistent with a mediational model, in which affect was found to mediate the association between coping and functional outcomes after controlling for disease severity. Adaptive coping was associated with higher PA, and PA was related to better functional outcomes, i.e. lower levels of pain and disability. Maladaptive coping was associated with higher NA, and NA was related to higher levels of pain. Using a latent structural equation modeling approach, the mediational model yielded a marginally acceptable fit to the data. Implications suggest the importance of assessing both PA and NA in order to fully understand the process of adjusting to chronic illness, as well as to identify mechanisms that lead to improved functional outcomes in systemic sclerosis.

Scleroderma, An Issue of Rheumatic Disease Clinics Maureen D. Mayes, MD, MPH 2015-08-03 Scleroderma, or systemic sclerosis, is a chronic connective tissue disease generally classified as one of the autoimmune rheumatic diseases. Hardening of the skin is one of the most visible

manifestations of the disease. It's estimated that about 300,000 Americans have scleroderma. About one third of those people have the systemic form of scleroderma. Since scleroderma presents with symptoms similar to other autoimmune diseases, diagnosis is difficult. This issue will cover:

Summary of Gabor Mate's When the Body Says No Milkyway Media

2022-04-28 Please note: This is a companion version & not the original book. Book Preview: #1 Raynaud's phenomenon is a condition in which the small arteries supplying the fingers are narrowed, depriving the tissues of oxygen. It can lead to gangrene, and in some cases, scleroderma. #2 The idea that people's emotional coping style can be a factor in scleroderma or other chronic conditions is anathema to some physicians. #3 The more specialized doctors become, the less they understand the human being in whom that part or organ resides. The people I interviewed for this book reported that neither their specialists nor their family doctors had ever invited them to explore the personal, subjective content of their lives. #4 Until the advent of modern medical technology and scientific pharmacology, physicians relied on placebo effects to treat their patients. Today, we have lost the ability to treat our patients based on their confidence in their inner ability to heal.

Managing Chronic Conditions Ellen Nolte 2008 This book examines the health system response to the rising burden of chronic disease in eight countries. It provides a detailed assessment of the current situation, a description of the policy framework and future scenarios, as well as evaluation and lessons learned.

When the Body Says No Gabor Maté, MD 2011-02-11 NATIONAL BESTSELLER In this accessible and groundbreaking book -- filled with the moving stories of real people -- medical doctor and bestselling author of *Scattered Minds*, Gabor Maté, shows that emotion and psychological stress play a powerful role in the onset of chronic illness. Western medicine achieves spectacular triumphs when dealing with acute conditions such as fractured bones or life-threatening infections. It is less successful against ailments not susceptible to the quick ministrations of scalpel, antibiotic or miracle drug. Trained to consider mind and body separately, physicians are often helpless in arresting the advance of most of the chronic diseases, such as breast cancer, rheumatoid arthritis, Crohn's disease, multiple sclerosis, fibromyalgia, and even Alzheimer's disease. Gabor Maté has found that in all of these chronic conditions, there is a common thread: people afflicted by these diseases have led lives of excessive stress, often invisible to the individuals themselves. From an early age, many of us develop a psychological coping style that keeps us out of touch with the signs of stress. So-called negative emotions, particularly anger, are suppressed. Dr. Maté writes with great conviction that knowledge of how stress and disease are connected is essential to prevent illness in the first place, or to facilitate healing. *When the Body Says No* is an impressive contribution to current research on the physiological connection between life's stresses and emotions and the body systems governing nerves, immune apparatus and hormones. With great compassion and erudition, Gabor Maté demystifies medical science and, as he did in *Scattered Minds*, invites us all to be our own health advocates. Excerpt from *When the Body Says No* "Only an intellectual luddite would deny the enormous benefits that have accrued to humankind from the scrupulous application of scientific methods. But not all aspects of illness can be reduced to facts verified by double-blind studies and by the strictest scientific techniques. We confine ourselves to a narrow realm indeed if we exclude from accepted knowledge the contributions of human experience and insight. . . . "In 1892 William Osler, one of the greatest

physicians of all time, suspected rheumatoid arthritis to be a stress-related disorder. Today rheumatology all but ignores that wisdom, despite the supporting scientific evidence that has accumulated in the 110 years since Osler first published his text. That is where the narrow scientific approach has brought the practice of medicine. Elevating modern science to be the final arbiter of our sufferings, we have been too eager to discard the insights of previous ages.”

In this comprehensive resource, Dr. Thomas Lehman--the head of one of the most prestigious pediatric rheumatology programs in the world--offers easy-to-understand information on the causes, symptoms, tests, and

treatments for a wide variety of rheumatic diseases and childhood pain. Dr. Lehman writes with great clarity, providing numerous case examples that illustrate the topic at hand and offering practical, down-to-earth advice. Equally important, he answers the questions that parents are most likely to ask: What should they observe in their children? What questions should they ask their doctor? Which tests are necessary? What risk factors should they be aware of? And how can they help their children cope with the social and psychological aspects of their illness. The book summarizes diagnostic tests, discusses the most effective medications, and discusses physical therapy, alternative therapy, and surgical options that are available. Clearly written, thorough, authoritative, and up-to-date, *It's Not Just Growing Pains* is the definitive resource available on the subject for parents and health care professionals, helping them to understand the children's pain and find the best available care.
